

# War is bad for the planet too!

It has been estimated that about 6% of the global carbon footprint results from military-related activity\*. This includes: ore extraction and manufacture of equipment and weaponry; trials and training with massive fuel use together with the maintenance of vast numbers of buildings; the use of fuels and explosives in war, plus resulting fires; extensive rebuilding of devastated infrastructure. This footprint should be recognised and taken fully into account when reduction targets are set for greenhouse gas emissions.

**For the sake of humanity and the planet, isn't it time to find better ways than warfare of resolving our disputes?**

Today there are better, more civilized ways of resolving conflict than by military means, through the channels now available: the United Nations and other well-established international institutions, international laws & treaties, and tried and tested non-violent methods of conflict avoidance and resolution. What is still needed is the will to utilise these resources effectively - a change of mind-set – a cultural change.

We need to resist the pressure of certain sections of big business such as arms companies which thrive on insecurity & conflict and relish the resulting “opportunities”. And we should be demanding much more serious funding for non-military security and non-violent conflict prevention and resolution work.

**Help save the planet by working for a more peaceful world.**
